

## Improvement

### Html

I have included more options to the print page to allow the user to have more access to our services and offer the user with more printing options.

### Images

I have improved the layout of most images to improve the user interface. I've included CSS to the images to make sure that everything that concerns images is easy to read and easy to understand.

### Nav bar

I have used Css to make the nav to be more interactive and more inclusive. The nav bar now includes a more eye-catching display and much more logical order.

I have included hover effects and accessibility considerations and used a grid layout for the Print page form that switches to a single column on mobile for better usability. And I have ensured the Google Maps iframe on the Contact Us page is responsive with max-width: 100%.

### Form Styling and Usability Improvements:

- Styled the page with a clean, white background container to distinguish it from the page background.
- Used CSS Grid to organize form fields in a two-column layout for desktops, improving space usage and readability.
- Included hover effects on the submit button for accessibility. Improved Footer
- Styled the footer with a dark background (and white text for contrast, matching the header for consistency).
- Centered footer content with text-align: center and added hover effects on links (text-decoration: underline).
